

# Enclosure Thermal Calculator Instruction Manual

 **Read before use**

- The selection result of calculation is intended to be used only as a guide and may not achieve the specified performance depending on the enclosure sealness, position of heat generating devices, and filter stain and so on.
- Using multiple products may cause the products to interfere with each other and prevent them from achieving their required performance. Use sufficient margin when making selections.
- The selection result of ventilation devices is calculated from only required capacity not considering the enclosure size, so check the devices are installable to the enclosure or not by yourself.
- Outdoor fan models are included in the selectable models for Indoor Enclosure Thermal Calculator, but these are selected for indoor use. Please note that the selection does not take into account the amount of heat transferred by solar radiation when used outdoors. When selecting for outdoor use, please use Outdoor Enclosure Thermal Calculator.

# What is Enclosure Thermal Calculator ?

Enclosure Thermal Calculator is a free tool designed to help you calculate the temperature inside the enclosure (Indoor/ Outdoor use) and find the right thermal management product to match your requirements.

## Calculable products

### In door use

Please select the heat management equipment in the panel.

Ventilation fan

Filter cassette with  
Ventilation fan

Louver with  
Ventilation fan

#### Notice:

The amount of heat generation in the panel must be calculated in advance.

※This is not necessary if the amount of heat generation is clear.

### Outdoor use

Please select the heat management equipment in the panel.

Louver with  
Ventilation fan

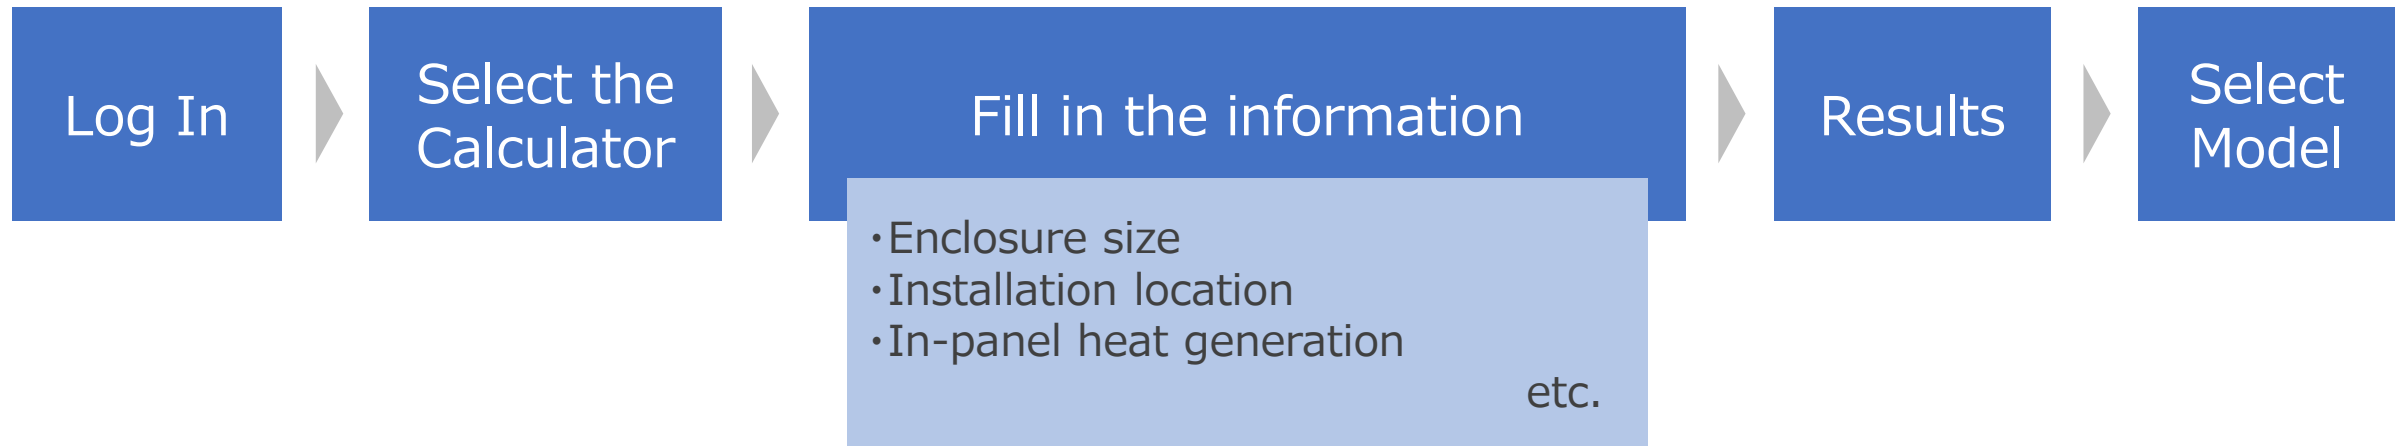

#### Notice:

The amount of heat generation in the panel must be calculated in advance.

※This is not necessary if the amount of heat generation is clear.

**Panel Condition Input**

Enclosure Condition

Dimensions (Width)	W =	<input type="text" value="1,200"/>	mm
Dimensions (Height)	H =	<input type="text" value="1,800"/>	mm
Dimensions (Depth)	D =	<input type="text" value="600"/>	mm
Thermal Conductivity	U =	<input type="text" value="Metal enclosure (U=5)"/>	W/(m <sup>2</sup> ·K)
Max. External Air Temp.	T1 =	<input type="text" value="40"/>	°C
		※Must be within Operating Temperature Range	
Permissible internal Enclosure Temp.	T2 =	<input type="text" value="50"/>	°C
		※Must be within Operating Temperature Range	
Heat Generation amount in enclosure	P =	<input type="text" value="300"/>	W
		※ If you do not know the amount, click here to calculate it.	

Calculation

### Fill in the information below

- Enclosure dimensions (W, H, D)
- Thermal Conductivity (U)
  - Select the material of the enclosure (Metal/Resin)
- Max. external air temp. (T1)
- Permissible internal enclosure temp. (T2)
  - Must be higher than (T1)
- Heat generated inside the enclosure (P)
  - The total value of the mounted equipment inside.
  - If the amount of heat generated cannot be determined, approximate values can be calculated from on-board equipment from the **“Calculation” button**.

### How to calculate in-panel heat generation

**Table A (amount clear)**

If the amount of heat generation of each device is **clear** → Use **Table A**

Input Parameters

**A. Devices with clear amount of heat generation**  
 >  Enter the parameters to green cells

Table A

Device name	Qty	Amount of Heat generation / 1pc.	Amount of Heat generation[W]
Device 1	2	100	
Device 2	3	150	
Device 3	1	200	

**\*Each cell must be filled**

① Fill in the green area

- Device name  
- Arbitrary name
- Qty.
- Amount of Heat generation  
- per 1pc.

# 2. How to use

## How to calculate in-panel heat generation

**Table A (amount clear)**

**In-panel heat generation calculator (estimate)**

In this tool, calculates simply accumulate amount of the general heat generation of the equipment in the panel.

**How to calculate**

(1) About devices with clear amount heat generation, please enter the data to table A.  
 (2) About devices without clear amount heat generation, please enter the data to table B.  
 (3) If you push the below calculation button, it will display the sum of Tables A and B as the total amount of internal panel heat generation ( estimate ).

**Input Parameters**

**A. Devices with clear amount of heat generation**  
 > Enter the parameters to green cells

Device name	Qty	Amount of Heat generation / 1pc.	Amount of Heat generation[W]
Device 1	2	100	200
Device 2	3	150	450
Device 3	1	200	200

**B. Devices without clear amount of heat generation**  
Note 1) If the rated capacity is 100W, enter 1000 for the "rated value, etc."  
Example : Input value is 400 when the rated output is 0.4kW.  
Note 2) If the load factor (operating ratio) is 100%, enter 100 for the "load factor".  
Example : Input value is 70 when this load factor is 70%.

When select to device, enter the number corresponding to the device in Table C below. > Enter the parameters to green cells

Device name	Qty	Rated value, etc.	Load factor(%)	Amount of Heat generation[W]

Table C ( Reference ) => <Click Me>

**Calculation Results**

Push the calculation button .

Calculation Heat generated amount in-panel (estimation): **850 W (approx.)**

Table A

**② Press the "Calculation" button**

**③ Total amount will be displayed**

**Calculation Results**

Push the calculation button .

Calculation
Heat generated amount in-panel (estimation):
850 W (approx.)
